

Figure D. A withdrawn 'together is worse', and a circler that disappears only at R 13, T 10

PROVISIONAL exhibit: evidence from merged PRs #27 (Lane 6, main @ 7c6f5ae), #29 and #30 (Lane 7, HR-009).

The new findings are proposed claims, not ledger entries. Ledger statuses (C038, C041) checked against research/claims.md @ 76ee3a6.

Pair = partners alone in 58 of 60 runs: the uninjured partner survives on its own (L6-008 I004: H0). The 2 dashed mismatches at s 0.05 are the split half being fragile; a lone, relaxed Orbiu survives 0.05 (Lane 4, L4-002).

b S101 under frontal addition (I003): the 'worse together' window is withdrawn

WITHDRAWN. Lane 7's HR-009c (PR #30, main @ 0b9b47f) with Lane 6's L6-009: the on-gap pulse splits the pair into two intact Orbia. On the 128² torus they later collide; zero-padded to 256², all 10 s 0.2-0.3 states end as two Orbia. The red-outlined runs are a world-size effect, not coupling. Only an off-gap s 0.3 result (L6-009, exploratory) remains open.

c, d S102 at its registered rule (R 13, T 10 only): a chaotic transient, not one death time

R 13, T 10 ONLY. Lane 3 (PR #29, main @ 20bdf9) reproduces these deaths at R 13, T 10, but no copy ends when either knob is refined: 0 of 29 runs at R 26 and 0 of 3 at R 39 (T 10); 0 of 24 at T 20 and 0 of 24 at T 40 (R 13), to 8000 tu. The collapse is an effect of the R 13, T 10 discretisation, not a lifetime of the rule. Refined runs are censored, not shown to be attractors.
